

**ENTROPY: EXPECTED SURPRISE**

# One Bobsled Race To Go

- Scenario 1
  - 2 teams tied for total time after 3 races
- Scenario 2
  - Swiss team is ahead by 22 seconds after 3 races
  - Announcer says there is only a 10% chance the American team will catch up and win gold
- NBC cuts to a commercial
- Comes back with a different sport!
- How much do you wonder about bobsled result?

# Later You Find Out

- Scenario 1: teams were tied
  - 1a: American team got gold
  - 1b: American team got silver
- Scenario 2: Swiss team way ahead
  - 2a: American team got gold
  - 2b: American team got silver
- How surprising is each of these outcomes?
- On average: how much surprise do you expect in each scenario?
- How much “information” do you get from learning the result?

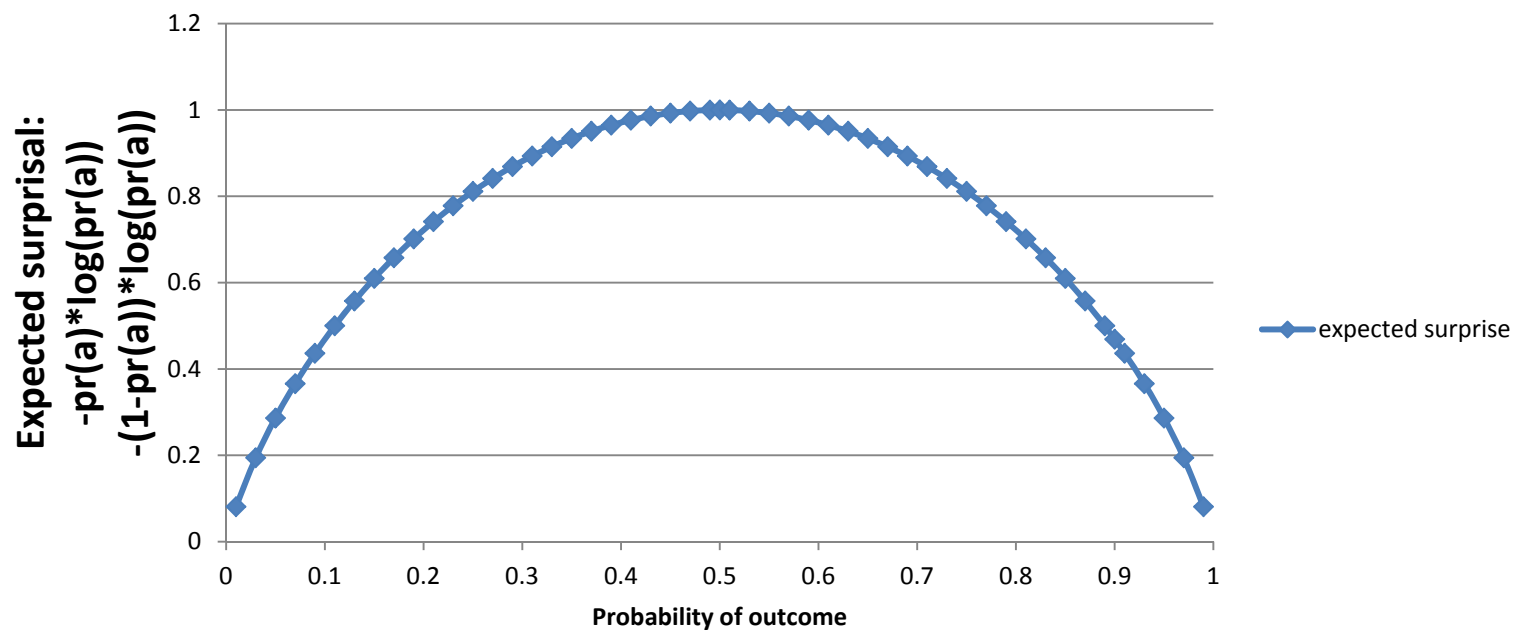

# Measuring Surprisal

- If outcome is unexpected, surprise is higher
- Assign probabilities to possible outcomes
  - Each probability is in  $(0, 1)$
  - Sum of probabilities is 1
- Quantify surprise of outcome  $a$  as
  - $-\log(\text{pr}(a))$

# Expected Surprise

- Scenario 1: teams were tied
  - With probability  $\frac{1}{2}$  Americans win
    - Surprise  $-\log(\frac{1}{2})$
  - With probability  $\frac{1}{2}$  Americans lose
    - Surprise  $-\log(\frac{1}{2})$
  - Expected surprise
    - $\frac{1}{2}(-\log(\frac{1}{2})) + \frac{1}{2}(-\log(\frac{1}{2}))$
- Scenario 2: Swiss way ahead
  - With probability .1 Americans win
    - Surprise  $-\log(.1)$
  - With probability .9 Americans lose
    - Surprise  $-\log(.9)$
  - Expected surprise
    - $.1(-\log(.1)) + .9(-\log(.9))$
- Which has greater expected surprise?

# The General Formula

- Mutually exclusive outcomes  $x_1, x_2, \dots, x_n$
- $-\sum_{i=1}^n pr(x_i) * \log(x_i)$ 
  - $(x_1, x_2) = .5, .5$ 
    - $-\frac{1}{2}\log(\frac{1}{2}) - \frac{1}{2}\log(\frac{1}{2}) = 1$
  - $(x_1, x_2) = .1, .9$ 
    - $-.1*\log(.1) - .9*\log(.9) = 0.469$

# Summary

- Surprisal is a measure of an outcome
- Expected (average) surprisal is a measure of a process with uncertain outcome
- Shannon defined “information” as expected surprisal, the uncertainty that will be resolved once outcome is revealed
- How much information in a message depends on what you knew before you got the message
